

2022 Uniform Reporting Summary Output Tables Executive Summary

State Mental Health Agencies (SMHAs) compile and report annual data as part of their application package for SAMHSA's Community Mental Health Block Grant. These compiled data constitute the Uniform Reporting System (URS).

The URS is comprised of 21 tables that are developed by SAMHSA in consultation with SMHAs. The 2022 URS Output Tables present findings from 59 states and U.S. territories. Each output table provides summary information on the SMHA clients served in 2022: sociodemographic characteristics of clients served, outcomes of care, use of selected evidence-based practices, client assessment of care, insurance status, living situation, employment status, and readmission to state psychiatric hospitals within 30 and 180 days. Key data highlights are listed below:

- In 2022, 8,180,236 clients received SMHA services from 59 states and U.S. territories. This is a decrease from 8,195,517 SMHA clients in 2021. There were 5,965,872 adults (or 23.1 per 1,000), 2,197,002 children (or 29.9 per 1,000) served. About 17,362 (0.2 percent) clients were missing age data.
- Among SMHA clients, there were 4,394,191 (53.7 percent) females served while there were 3,730,939 (45.6 percent) males served. In 27 states and U.S. territories, more SMHA males were served than females, while in 32 states and U.S. territories, more SMHA females were served.
- The age distribution among SMHA clients was the largest among ages 25-44 with 33.0 percent, followed by ages 45-64 with 22.8 percent, children ages 0-12 with 14.2 percent, and children ages 13-17 with 12.7 percent.
- The highest percentage of SMHA clients that were served was among the White population with 57.9 percent, followed by Black or African Americans with 17.4 percent. SMHA clients served were 15.8 percent Hispanic and 74.5 percent non-Hispanic.

North Dakota 2022 Mental Health National Outcome Measures (NOMS): SAMHSA Uniform Reporting System

Utilization Rates/Number of Consumers Served	U.S.	State	U.S. Rate	States
Penetration Rate per 1,000 population	8,180,236	15.14	24.37	59
Community Utilization per 1,000 population	7,900,059	15.04	23.53	59
State Hospital Utilization per 1,000 population	108,725	0.93	0.33	53
Other Psychiatric Inpatient Utilization per 1,000 population	433,997	1.03	1.53	42

This table uses data from URS Table 2a, Table 2b and from the U.S. Census Bureau. All denominators for penetration rates use the U.S. Census data from 2021.

U.S. totals are calculated uniquely for each data element based on only those states who reported clients served.

The penetration rates for 'Other' gender as well as Age, Gender, Race and Ethnicity Not Available are not reported on this table because the U.S. Census data does not include these categories.

Regional groupings are based on SAMHSA's Block Grant Regions.

Note:

This table uses data from URS Table 14a, Table 14b and from the U.S. Census Bureau. All denominators use the U.S. Census data from 2021.

U.S. totals are calculated uniquely for each data element based on only those states who reported clients served.

The penetration rates for 'Other' gender as well as Age, Gender, Race and Ethnicity Not Available are not reported on this table because the U.S. Census data does not include these categories.

Regional groupings are based on SAMHSA's Block Grant Regions.

Residential Treatment Centers None

Overall None

APPROPRIATENESS DOMAIN: Percent of Adults and Children Served Who Meet the Federal Definition for SMI/SED and Percent of Adults and Children Served Who Have Co-Occurring MH/SU Disorders, FY 2022

North Dakota

Reporting Period: 7/1/2021 To: 6/30/2022

Adults and Children who meet the Federal Definition of SMI/SED	State	US Average	US Median	States Reporting
Percent of Adults served through the SMHA who meet the Federal definition for SMI	40.4%	69.7%	74.0%	57
Percent of Children served through the SMHA who meet the Federal definition for SED	55.4%	69.0%	74.0%	57

Co-occurring MH and Substance Use Consumers	State	US Average	US Median	States Reporting
Percent of Adults served through the SMHA who had a co-occurring MH and SU disorder	44.0%	26.4%	22.5%	56
Percent of Children served through the SMHA who had a co-occurring MH and SU disorder	16.0%	5.7%	2.5%	56
Percent of Adults served through the SMHA who met the Federal definitions of SMI who also have a substance use diagnosis	76.0%	29.8%	24.0%	56
Percent of Children served through the SMHA who met the Federal definitions of SED who also have a substance use diagnosis	25.0%	10.5%	3.0%	56

Note:

This table uses data from URS Table 12.

How are the number of clients with co-occurring disorders counted and calculated?

Percentage of adults served by the SMHA who also have a diagnosis of substance use problem and Percentage of children/adolescents served by the SMHA who also have a diagnosis of substance use problem are derived from the data reported for Table 2. Percentage of adults meeting Federal definition of SMI who also have a diagnosis of substance use problem and Percentage of children/adolescents meeting the Federal definition of SED who also have a diagnosis of substance use problem are derived from the data reported for Table 14.

General Notes FY 2022

North Dakota

URS Table Number	General Notes
3	Regarding the difference in the number of clients served at the state hospital in comparison to the previous URS reporting year, the State of ND reviewed the selection criteria for the BCI file and made modifications to more accurately conform to the data extract specifications. Modifications to the BCI file extract, which is used to populate the URS tables, pulled additional clients in comparison to the previous year that account for the difference.
6	The difference in the total number of clients served in Community Programs at the beginning of the year is likely attributable to review of the selection criteria for the BCI file. The State of ND reviewed the selection criteria for the BCI file and made modifications to more accurately conform to the data extract specifications. These modifications allowed a broader selection of clients receiving screening services to be included in the data and would appear as admits to outpatient community programs.
6	The difference in length of stay of children discharged from State Hospitals is based on a total of 1 individual. Normally, the State Hospital provides no services to minors; however, this instance represents an edge case that would not be expected to re-occur with any frequency in the future.
6	The difference in length of stay of adults discharged from State Hospitals in comparison to the previous reporting year is likely an artifact of our skilled staff and improved care. Length of stay at the State Hospital has been decreasing over a span of 10 years.
7	The increase in Medicaid Expenditures during this reporting period is related to the timing of billing.
7	The increase in MHBG expenditures was caused by several factors, including utilization of FEP funding for a pilot program, as well as utilization of MHBG funding for North Dakota's Community Connect and Free Through Recovery programs.
7	The increase in Primary Prevention Expenditures is tied to suicide prevention dollars. The increase in expenditures is likely due to an increase in contracts with providers.
7	The total EBP for ESMI cost increase is related to minimal spending in 2021 due to a contract ending with the main provider. Additionally, there was a large amount of spending in 2022 due to a larger transfer of FEP funding toward a pilot program within two of ND's human service centers.
7	The increase in Total Other Expenditures was caused by increased salaries, overtime, and retention bonuses that were paid as a result of COVID funding.
7	The difference in Total Other Funds Expenditures was caused by an incorrect department ID being included in the calculation for 2021 and 2022. The correct amount for 2022 has been entered in this report, which brings the difference from year-to-year closer to what would be expected.
7	The differences in 24-Hour Care Expenditures and Total Ambulatory/Community Non-24-Hour Care Expenditures are due to an error in the 2021 reporting period. The 2022 numbers listed in this report are correct.
7A	The difference in expenditures around First Episode Psychosis (FEP) in comparison to the previous reporting year is due to a contract termination in the 2021 reporting year. The ND contracted provider terminated the contract to provide FEP services on April 30, 2020. ND was unable to contract to provide FEP services from 7/1/2020-6/30/2021 due to COVID-19 and other factors. For the 2022 reporting cycle, ND had a Memorandum of Agreement with our Field Services Division to implement FEP services in two Human Service Centers (community mental health providers) starting 9/1/2021. Additionally, two teams for July, Aug, and Sept in FY2022 were paid with MHBG dollars as a measure for implementing FEP in two of our Field Services locations. This resulted in the expenditure being much higher than would be expected going forward.
9, 11	Regarding the difference in the percent of children/adolescents reporting positively about outcomes in comparison to the previous URS reporting year, the difference is likely due to a change in survey distribution method. In the 2021 reporting year, the surveys were distributed by mail and returned by the clients via mail. In the 2022 reporting year, the surveys were made available directly at field locations. A lower response rate was achieved in 2022 because staff were not used to distributing the surveys in the field, which likely created different results than previous survey collections.

URS Table Number	General Notes
12	Regarding the difference in percentage of adults with co-occurring MH/SA diagnosis in comparison to the previous reporting year, this is most likely due to review of the selection criteria for the BCI file. The State of ND reviewed the selection criteria for the BCI file and made modifications to more accurately conform to the data extract specifications. These modifications allowed a broader selection of clients receiving screening services to be included in the data. The SUD diagnosis column has a default of not applicable if no SUD code is found. Similarly, the mental health diagnosis fields have a default of unknown if no diagnosis code is found. The decrease in co-occurring SUD and mental health diagnosis is likely an issue of the selected clients having a higher incidence of unknown diagnosis vs. an actual decrease in this metric. This can be seen by evaluating the number of unknown mental health diagnoses; the 2022 data has an unknown rate of 33% vs. 24% in 2021. This change is likely due to including clients with less robust data available because they received less complex services, such as a screening that may not result in a complete exploration of all potential SUD and mental health diagnoses.
14A	The percentage change in the number of multi-racial clients with SMI/SED in comparison to the previous reporting year is attributable to the fact that the total number of clients in this demographic category is very small. Any fluctuation in this number will result in what appears to be a large percentage change from year-to-year.
15	The percentage change in the number of people with a living situation of Homeless/Shelter and in Jail/Correctional Facility in comparison to the previous reporting year needs to be understood in the context of the number of individuals reported. In 2021, the number of people identified with a living situation of Homeless/Shelter was 9.12% of the population reported; in 2022 it is 10.91%. Total percentage of the population reported increased less than 2%, which likely indicates relative stability from year-to-year. In the case of people identified with a living situation of Jail/Correctional Facility, 2021 shows 3.66%, while 2022 shows 4.17% of the total population reported. Total percentage of the population reported changed by less than 1% in this case, representing relative stability. While the number of individuals in these living situations increased, simple comparison of the count from year-to-year is not sufficient analysis. There are likely multiple contributing factors in the mild increase in these two populations; the SMHA serves the individuals with the greatest need in the state of ND, which includes people who have a higher likelihood for homelessness and interaction with the legal system.
16	The Therapeutic Foster Care data is extracted from a system that is separate from North Dakota's primary EHR system. There is no ID relationship between the data in the EHR and this system. Therefore, it is not possible to break down the demographics of the counts in the same manner as the other columns in this table. There is no way to resolve this given the disparity between the data sources. The Therapeutic Foster Case data is available as a total count only.
16	The difference in the percentage of clients receiving Supportive Employment services in comparison to the previous year is due to the total count of individuals in this category being low (27 in 2022 vs. 21 in 2021). The difference in count is 6 individuals; therefore, the relative percentage change will likely be high with any fluctuation in the total.
16	The difference in percentage of clients receiving ACT services in comparison to the previous year has multiple possible causes. First, the ACT services required manual calculation in the 2022 reporting year due to a system change that removed the service as a best practice option from the case notes within the EHR system. The need for manual calculation based on records kept by staff makes this measurement more difficult in comparison to the previous year. Secondly, the ACT model used prescribes a specific client to staff ratio of 10:1. With workforce shortages being a factor for the State of ND Human Service Centers in 2022, this could have affected the ability to provide this service at the same level as the previous year.
16	The difference in the percentage of clients receiving MST services in comparison to the previous year is due to the total count of individuals in this category being low (23 in 2022 vs. 18 in 2021). The difference in count is 5 individuals; therefore, the relative percentage change will likely be high with any fluctuation in the total. It should be noted that MST services required manual calculation in 2022 due to a system change that removed the services as a best practice option from the case notes within the EHR system. The need for manual calculation based on records kept by staff makes this measurement more difficult in comparison to the previous year.
16, 17	Regarding fidelity measurement, the State of ND has additional internal mechanisms. Our Treatment Team Fidelity is our own creation based on best practices for individuals with SMI and SUD; the statewide management team measures fidelity in this strategy. The State also uses Practice Model Fidelity, which is an internal measure conducted by a statewide team as well as by individual teams at each of our Human Service Centers. This practice model has components of ACT and IDDT (best practice components of intensive community outreach).
16B	The State's crisis call center does not have the ability to assess if an individual has an SMI/SED diagnosis. This work would be done by a clinician outside the scope of a call to our contracted crisis center. The numbers provided in table 16B for call centers reflect the total number of adults and children served by the call center regardless of the presence of an SMI/SED diagnosis.

URS Table Number	General Notes
17	The sharp percentage increase in family psychoeducation from reporting year 2021 to 2022 is most likely due to a change in practice. In spring 2022, North Dakota's Human Service Center fidelity review introduced and included assessment for family psychoeducation as part of best practice. Clinical Directors provided reinforcement to their local staff regarding correct documentation for the use of family psychoeducation and reinforced through audit.
20A	The decrease in non-forensic readmits for both 30 and 180 days does not have a definite cause that the State can identify at this time.
20B	The percentage change from 2021 to 2022 for 30-day re-admits is based on a total change from 2 individuals in 2021 to 4 individuals in 2022. Any fluctuation in this low total count would result in what appears to be a large percentage change.

Errata Sheet to the 2022 URS Output Tables

This page includes clarifications and corrections to the 2022 URS Output Tables.
